Section 13-3 Cell Transformation (pages 327-329)

Key Concepts
- What happens during cell transformation?
- How can you tell if a transformation experiment has been successful?

Introduction (page 327)
1. What occurs during transformation?

2. Is the following sentence true or false? Griffith’s extract of heat-killed bacteria contained DNA fragments.

Transforming Bacteria (pages 327-328)
3. Complete the flowchart to show the steps in transforming bacteria.

   Foreign DNA is joined to a(an)____________________, which is a small, circular DNA molecule found naturally in some bacteria.

   Recombinant plasmids are mixed with bacterial cells. Some bacterial cells take in the recombinant DNA by the process of __________________________.

   The culture is treated with a(an)____________________, a compound that kills bacteria.

   Only cells that have been transformed survive, because only they carry a(an)________________ for antibiotic resistance.

4. Give two reasons why a plasmid is useful for DNA transfer.
   a. ________________________________

   b. ________________________________

Transforming Plant Cells (pages 328-329)
5. When researchers transform plant cells using a bacterium that causes plant tumors, how do researchers prevent plant tumors from forming in the transformed cells?
6. Circle the letter of each sentence that is true about transforming plant cells.

   a. Many plant cells can be transformed by using a bacterium that will, in nature, insert a tumor-producing plasmid into plant cells.

   b. Sometimes plant cells in culture will take up DNA on their own when their cell walls are removed.

   c. It is impossible to inject DNA directly into plant cells.

   d. Plant cells that are transformed cannot develop into adult plants.

7. Describe what occurs in a successful transformation of cells.

   ____________________________________________________________

   ____________________________________________________________

   ____________________________________________________________

   ____________________________________________________________

Transforming Animal Cells  (page 329)

8. Describe how animal cells can be transformed by directly injecting DNA.

   ____________________________________________________________

   ____________________________________________________________

   ____________________________________________________________

   ____________________________________________________________

9. Is the following sentence true or false? The DNA molecules used for transformation of animal cells do not require marker genes. __________________

10. How is a DNA molecule constructed so that it will eliminate a particular gene?

    ____________________________________________________________

    ____________________________________________________________

    ____________________________________________________________

11. Is the following sentence true or false? Gene replacement has made it possible to identify the specific functions of genes in many organisms. __________________

Reading Skill Practice

When you read about related concepts, a compare-and-contrast table can help you focus on their similarities and differences. Construct a table to compare and contrast transformation in bacteria, plants, and animals. Look in Appendix A of your textbook for more information about compare-and-contrast tables. Do your work on a separate sheet of paper.
